

1. Our agent is accountable for turning a consulate's document checklist into a fully verified, signed and paid-for application with every physical document at the right place and an appointment booked by the applicant's target date, without the applicant having to chase a bank, an agent, or a helpline themselves.
2. L3 because:
 - a) With upfront consent, our agent acts independently within clear boundaries: fetches authorized data, confirmed phone numbers, approved document locations, and pre-approved spend. Anything outside those limits is handed back to the applicant.
 - b) We stop short of L4 because it won't make judgment calls with irreversible consequences, such as deciding whether a document is good enough for a consulate or retrying a bank indefinitely. It can correct itself where the action is reversible and stays within L3.
- 3.

4.Capability 1

Name: 'transcribe_speech'

Used at: Intake

Rail: Voice

What you send it: 16kHz mic audio, language hint

What comes back: Interim + final transcript

When it fails: Partial transcript + error code

What it must never do: Guess unclear destination, date, or amount

What exists today: Gnani Prisma v2.5 STT Realtime

Build Status: EXISTS

Capability 2

Name: 'speak_reply'

Used at: Voice states

Rail: Voice

What you send it: Text, language, voice ID

What comes back: Streamed audio

When it fails: Errors instead of using stale data

What it must never do: Read unverified document, date, or amount

What exists today: Gnani Timbre v2.0 TTS Realtime

Build Status: EXISTS

Capability 3

Name: 'call_bank_rm_or_desk'

Used at: GapResolution -> VoiceChase

Rail: Voice

What you send it: Phone, countryCode, name, checklist item ID

What comes back: Call trigger, then status, disposition, transcript

When it fails: 400 or 403 for invalid or unwhitelisted numbers

What it must never do: Call an unapproved number

What exists today: Gnani Trigger Call API

Build Status: PARTIAL. Production scale requires commercial access

Capability 4

Name: 'read_call_outcome'

Used at: After VoiceChase

Rail: Voice

What you send it: conversationId

What comes back: Status, disposition, transcript

When it fails: Poll or use webhook until analytics complete

What it must never do: Mark an item resolved just because a call connected

What exists today: Gnani Conversation Statistics API

Build Status: EXISTS

Capability 5

Name: 'navigate_ivr'

Used at: VoiceChase IVR calls

Rail: Voice

What you send it: DTMF sequence

What comes back: Tone registration confirmation

When it fails: Stops if the menu structure changes

What it must never do: Guess unmapped menu options

What exists today: Gnani DTMF Collection

Build Status: EXISTS

Capability 6

Name: 'pull_case_status_into_call'

Used at: VoiceChase

Rail: Voice

What you send it: Applicant or case ID

What comes back: Live checklist status

When it fails: Times out and continues the call

What it must never do: Leave the caller waiting on our backend

What exists today: Gnani Custom Integrations

Build Status: PARTIAL. Gnani capability exists; our endpoint must be built

Capability 7

Name: 'request_aa_consent'

Used at: ConsentGranted

Rail: Payments

What you send it: Applicant mobile/VUA, purpose

What comes back: Consent ID, status, approved AA

When it fails: Stops on rejection. No automatic re-request

What it must never do: Pre-select applicant accounts

What exists today: Setu by Pine Labs Account Aggregator Gateway

Build Status: EXISTS

Capability 8

Name: 'fetch_bank_data'

Used at: DataFetched

Rail: Payments

What you send it: Consent ID, date range

What comes back: Balances, transactions, income/spend signals

When it fails: Stops if bank is not a linked FIP

What it must never do: Fabricate or reuse data outside the checklist item

What exists today: Setu by Pine Labs Account Aggregator Gateway

Build Status: EXISTS, with linked-bank coverage caveat

Capability 9

Name: 'verify_pan'

Used at: DataFetched

Rail: Payments

What you send it: PAN number

What comes back: Valid or invalid + name match

When it fails: Stops on NSDL outage

What it must never do: Forward PAN beyond this check

What exists today: Pine Labs Identity as a Service

Build Status: EXISTS

Capability 10

Name: 'fetch_digilocker_doc'

Used at: DataFetched

Rail: Payments

What you send it: DigiLocker consent, document type

What comes back: Requested address or ID document

When it fails: Stops if document type is unavailable

What it must never do: Request an unconsented document

What exists today: Pine Labs Identity as a Service

Build Status: EXISTS

Capability 11

Name: 'esign_document'

Used at: PackageComplete

Rail: Payments

What you send it: Document hash, Aadhaar-linked mobile

What comes back: Aadhaar OTP eSigned document

When it fails: Stops on OTP failure or timeout

What it must never do: Trigger OTP before applicant sees document

What exists today: Pine Labs Identity as a Service

Build Status: EXISTS

Capability 12

Name: 'collect_payment'

Used at: PayFee

Rail: Payments

What you send it: Order amount, purpose

What comes back: Payment link/status, transaction ID

When it fails: Stops on decline

What it must never do: Charge more than the confirmed amount

What exists today: Pine Labs Payment Gateway / Payment Links

Build Status: EXISTS

Capability 13

Name: 'issue_bank_letter'

Used at: GapResolution, funds-proof branch

Rail: Payments

What you send it: Bank letter request

What comes back: Bank-issued, consulate-format signed statement

When it fails: No existing automated path

What it must never do: Treat AA transaction data as a bank-issued letter

What exists today: No existing solution. AA provides transaction data and eSign only signs documents we hold

Build Status: MISSING. Requires VoiceChase + CourierPickup workaround

Capability 14

Name: 'check_serviceability'

Used at: ChecklistBuilt

Rail: Logistics

What you send it: Pickup and drop pincodes

What comes back: Serviceable Y/N by mode

When it fails: Stops and does not book

What it must never do: Book an unserviceable pickup

What exists today: Delhivery Pincode Serviceability

Build Status: EXISTS

Capability 15

Name: 'schedule_document_pickup'

Used at: GapResolution → CourierPickup, DocsInTransit

Rail: Logistics

What you send it: Pickup/drop addresses, time window, documents

What comes back: AWB and pickup confirmation

When it fails: Stops if hand-off fails

What it must never do: Move originals without a chain-of-custody scan

What exists today: Delhivery Express Pickup and Shipment APIs

Build Status: PARTIAL. Standard pickup API exists; same-day API availability needs confirmation

Capability 16

Name: 'track_shipment'

Used at: DocsInTransit

Rail: Logistics

What you send it: AWB number

What comes back: Live status, NDR if undelivered

When it fails: Reports NDR instead of assuming delivery

What it must never do: Mark delivery without a confirming scan

What exists today: Delhivery Shipment Tracking

Build Status: EXISTS

Capability 17

Name: 'standardise_address'

Used at: Intake / ChecklistBuilt

Rail: Logistics

What you send it: Free-text address

What comes back: Structured, geocoded address

When it fails: Flags unresolved addresses

What it must never do: Silently change the applicant address

What exists today: Delhivery Maps Address Standardisation

Build Status: EXISTS

Capability 18

Name: 'estimate_route'

Used at: AppointmentBooking, DocsInTransit

Rail: Logistics

What you send it: Origin, destination, vehicle type

What comes back: Distance, ETA, route

When it fails: Uses API result without inventing an ETA

What it must never do: Promise greater ETA precision than the API provides

What exists today: Delhivery Maps Routing / Distance Matrix

Build Status: EXISTS

5. Yes, for insurance issuance, since Pine Labs can only collect the premium and cannot underwrite a policy or generate the insurance certificate required by a consulate. We would use ACKO Insurance as the fourth rail since it already offers digital travel insurance and has an API oriented, paperless issuance model. A travel insurance issuance API would let our agent generate the actual policy within the same workflow, rather than only collecting payment.

6. Primary: WhatsApp. That's where our Round 1 story already lived: a professor and visa agent coordinating over calls and a WhatsApp group for a learning trip. Our agent fits into that same 'human system'. The applicant starts a chat with our agent's WhatsApp number, gives destination, dates and travel type in plain language, and everything after that: the checklist, the one-time AA/DigiLocker consent link, the payment link, status nudges ("Your bank confirmed the statement will be ready Thursday", "Picking up your document from HDFC Koramangala at 3pm, track here") and arrives as WhatsApp messages and tap through links.

Secondary: Voice. If the applicant prefers to call, Gnani's speech-to-text and text-to-speech handles a live spoken exchange in Hindi or English, while keeping it tied to the same case.

Tertiary: Web checklist, one link opened from WhatsApp, for anyone who wants to see every item and its state at once, instead of scrolling chat history.

7. "Raahi" (the Hindi word for "traveller")

8. Atlys: It recently raised \$36M in funding, with MakeMyTrip joining as an investor, and operates at a 700,000+ visa/year run rate. It already owns the visa workflow, documents and payments, adding AA, voice and logistics rails is a natural extension.
